Mobile Back Office

Simplify and streamline the stock-handling process

Priority Mobile Back Office is a dedicated, user-friendly mobile application tailored for storekeepers and staff. Its intuitive interface enables seamless stock item management, allowing users to easily receive and release items anywhere within the store. The application is optimized to run on integrated mobile devices equipped with a scanner, which significantly reduces errors and streamlines inventory processes.

With the built-in scanner, users can swiftly respond to stock-related tasks from the head office or other stores. The scanning feature minimizes errors in stock records, enhancing productivity and ensuring efficient store operations, leading to improved customer satisfaction. Priority Mobile Back Office empowers storekeepers and staff to streamline stock management and deliver excellent service seamlessly.

Easily receive and release stock items from anywhere within your store

No more scattered packages on the store floor during working hours

Efficiently perform physical inventory and item availability inquiries

The Priority Mobile Back Office application provides advanced stock handling capabilities:

Stock transfers between warehouses and stores

- Receive stock items that arrived in the store from a supplier and/or between stores
- Receive items anywhere in your store by easily scanning their barcodes
- Compare received items to the courier's shipping certificate and/or the purchase order
- Accept returned items

Release of stock items/goods

- Allows easy transfer of goods from the store or warehouse to another store
- Automatic scanning and recording of out items

Stocktaking – Easily accomplish stocktaking using powerful barcode scanning capabilities and stores

Item availability inquiry – Scan a barcode to view its availability across all chain stores

- ▶ The application can either be installed on a dedicated handheld device that serves as a mobile POS or on any iOS or Android mobile device with scanning capabilities.
- ▶ As soon as goods are scanned, the system updates the inventory in real time.
- ▶ In both options, the application uses cellular communications to communicate with the back-office and does not require the deployment of a wireless network in the store.

Transit Warehouse

The mobile back office application also supports 'Transit Warehouse', where the courier vehicle transferring goods is regarded as an intermediate warehouse that receives the goods from one store and moves it to another. This allows ease of tracing back missing items lost during the transfer process.
